

Calloto

MARKETING PLAN

Never lose a customer to a missed call.

Missed-call text-back for UK businesses · £19/mo · Trades first

Version 1.0 · August 2026 · Prepared for Mudit Gupta

1 Executive Summary

Calloto turns missed calls into booked jobs for UK businesses that can't always answer. When a customer calls while a business is on a job, in a meeting, or on the road — a plumber up a ladder, a salon mid-appointment, a clinic with patients — Calloto detects the missed call in seconds and texts the customer back automatically: the business's name, a rough price range, and a one-tap booking link. The customer books on the spot instead of calling the next business. £19/month, no contracts, 5-minute setup, works with the existing number.

The business is currently in validation: a live landing page and waitlist (early-bird £19/mo locked for signups), built on the founder's existing Voxvaani voice/WhatsApp stack — which gives Calloto a real moat: WhatsApp-native, DLT-compliant text-back, not a generic SMS gateway.

Strategy in one sentence

Own the 'missed call booked job' moment for UK businesses — trades as the flagship wedge, every other call-heavy vertical as expansion — at a price a single job pays for, distributed where businesses actually are: search, Facebook trade groups, local directories, and word of mouth.

Element	Position
Product	Missed-call auto text-back + booking link for any business (SMS & WhatsApp); trades are the flagship vertical
Market	UK micro businesses that live by the phone: trades first (plumbers, electricians, builders), then salons, clinics, estate agents, repair services
Price	£19/mo early-bird, per trade business; one missed job (£200–£1,000) pays for a year
Stage	Validation — landing live, waitlist open, gate = 50+ real signups in 3 weeks
North star	Number of paid businesses
Moat	Voxvaani stack: WhatsApp Business API, DLT-compliant templates, virtual-number call detection
90-day goal	20+ paying businesses, ~£380 MRR, CAC under £40, payback under 2 months

Note: all forward numbers in this plan are planning targets based on industry benchmarks — they are hypotheses to be replaced by actuals, not predictions of performance.

2 Product & Positioning

Value proposition

For UK businesses that lose customers because they can't always answer, Calloto is the automatic receptionist that replies to every missed call with a text — name, price, booking link — so the customer books before they can call anyone else. Trades are the flagship use case (their pain is loudest and most measurable); the same flow serves salons, clinics, estate agents and repair services with per-industry message templates. Unlike lead-generation marketplaces that charge per lead or CRMs that require new workflows, Calloto is a flat-fee service that pays for itself with one job.

Five product pillars

- Catch — missed call detected in seconds. No app to keep open, no new number.
- Reply — instant auto text-back: trader's name, 'thanks for calling', rough price range they set.
- Book — one-tap booking link with live availability; customer books while the trader is still on the ladder.
- See — missed-call feed: every call, every reply, every booked job in one dashboard.
- Fit — works with the existing number, 5-minute setup, quiet-hours control, WhatsApp text-back option, per-industry message templates.

Positioning statement

For / Who / That / Unlike / Ours

For UK micro businesses that lose customers to unanswered calls — trades first, then salons, clinics, estate agents and repair services, who are on a job, in a meeting, mid-appointment, or on the road when the phone rings, Calloto is a missed-call text-back service that replies to customers instantly with the business's name, a rough price and a booking link, unlike per-lead marketplaces (Checkatrade, Bark) and heavyweight field-service CRMs, because it is flat-fee, WhatsApp-native, and set up in five minutes with no new number.

Competitive whitespace

Option trades use today	How it works	Cost	The gap Calloto fills
Nothing / voicemail	Call goes to voicemail, callback later	£0 — lost jobs	Customer has already booked elsewhere by callback
Lead-gen marketplaces (Checkatrade, MyBuilder, Bark, TrustATrader)	Pay per lead or subscription for lead flow	£10–£50+ per lead; heavy competition	Own the leads you already get — no bidding war, no per-lead fee
Generic missed-call SMS (TeleMessage, TextMagic, etc.)	SMS alert/auto-reply via gateway	£20–£60/mo + per-message	No WhatsApp-native reply, no booking link, clunky setup
Field-service CRMs (Jobber, Housecall Pro, Tradify)	Full job management suite	£25–£60+/mo, complexity	Overkill — 90% of features unused; Calloto is one job, one flow
Calloto	Missed call instant text-back + booking link	£19/mo flat, unlimited missed calls	Instant time-to-value, WhatsApp-native, price of one job pays for a year

3 Market Analysis

Market size & shape

- UK construction and trades employ well over 1.5M people, the large majority in businesses of 1–10 people — sole traders and micro firms dominate.
- ~140k plumbers/heating engineers, ~220k electricians, plus roofers, locksmiths, gardeners, cleaners and builders — each a segment that lives and dies by inbound calls.
- Adjacent call-heavy verticals expand the platform TAM: ~40k salons & barbers, ~15k dental practices, thousands of estate agents, mobile mechanics and repair services — all miss calls they can't answer.
- Across trades + adjacent verticals the addressable base is 400k+ UK micro businesses that lose revenue to unanswered calls.
- One missed call is typically £200–£1,000 of work for a trade, or a full booking for a salon/clinic — so £19/mo is a rounding error against a single recovered customer (landing page copy: 'one missed job pays for a year').

The pain is structural, not occasional

- Trades are physically unable to answer while working — hands dirty, up a ladder, driving.
- Customers call several traders to get a quote; the first to respond wins the job. Speed-to-response is the single biggest factor in conversion.
- Lead-generation platforms are expensive and bid-driven; trades resent paying for leads they feel they should have won anyway.
- Existing solutions are either too simple (no booking, no WhatsApp) or too complex (full CRM).

Why now

- WhatsApp Business API + DLT templates are now accessible to small builders at realistic cost — the moat is reachable.
- UK trades are digitally responsive: they live in Facebook trade groups, use booking links from Checkatrade, and adopt simple tools fast.
- The founder already operates Voxvaani (voice & WhatsApp automation) — the delivery stack exists; the marginal cost of adding Calloto is product work, not infra.

4 Target Audience & Segments

Ideal customer profile (ICP)

- Who: UK micro business (1–5 people) that lives by the phone — sole trader trade, salon, clinic, estate agency; typically 30–60.
- Behaviour: takes calls all day, misses several per week, quotes/books by phone, loses customers to whoever answers first.
- Current spend: pays Checkatrade/Bark for leads (trades), or relies on word of mouth and Google reviews (everyone).
- Tech profile: smartphone-first, not SaaS-savvy; wants to set it up in minutes and forget it.
- Trigger event: 'I was on a job and missed a call — they booked someone else.' Heard from the van, the salon chair, the trade group.
- Platform rule: one generic flow + per-industry message templates. The waitlist's segment picker records demand per vertical, so the data — not opinion — picks the next beachhead after trades.

Persona — 'Paul the Plumber'

Paul, 44, sole trader heating engineer, West Midlands

Works alone in a van, 6 days a week. Misses 5–10 calls a week while on jobs — a mix of new customers, insurance call-outs and emergency repairs. Spends ~£150/mo on lead platforms and hates it. Lost a £1,800 boiler swap last month because the customer called the next guy while Paul was under a sink.

Paul's bar for adopting a tool: set up in one evening, nothing to install on his phone, no new number to print on the van. Calloto's pitch — 'texts them back with your name and a price while you're still working' — maps exactly to the £1,800 job he just lost.

Segments & prioritisation

Priority	Segment	Why / behaviour	Entry angle
P1 — wedge	Plumbers & heating engineers	Highest call volume, emergencies, winter spikes, already pay for leads	Boiler emergency angle: 'customer needs a fix now, not later'
P1 — wedge	Electricians	High inbound, fast-moving quotes, many solo traders	'First to respond wins the rewire'
P2	Roofers & locksmiths	Urgent, high-value, poor response = lost job	Emergency repair angle
P2	Gardeners, cleaners, window cleaners	Lower ticket but very high call volume, price-sensitive	Volume angle: 'every missed call is a quote gone'
P2 — expand	Salons & barbers	Missed booking calls = silent churn; appointment culture	Booking angle: 'turn a missed call into a booked chair'
P2 — expand	Clinics & dentists	Rescheduling-heavy; patients call back anywhere	Care angle: 'never keep a patient waiting in voicemail'
P2 — expand	Estate & letting agents	Enquiries are time-critical; agents are often out	Viewing angle: 'answer every enquiry, even mid-viewing'

Priority	Segment	Why / behaviour	Entry angle
P3	Builders & general contractors	Longer sales cycles, fewer calls, referral-heavy	Keep warm via content; not launch focus

5 Messaging Framework

Hero message

Never lose a customer to a missed call.

A customer calls while you're on a job, in a meeting, or on the road. Calloto texts them back instantly — your name, a rough price, and a booking link. They choose you, not the next business that picks up.

Message variants by channel

Channel	Message angle
Google Search ad	'Missed calls costing you customers? Calloto texts them back with your price & booking link — £19/mo. 5-min setup.'
Facebook / Instagram	Video: POV you're on a job and the phone rings — cut to the customer's phone getting your text. 'They book. You never knew.'
Trade group post	'Genuinely annoying how many jobs I lost to missed calls. Now calls text themselves back. £19/mo, no contract — happy to show anyone who asks.'
Salon/clinic community post	'How many no-shows actually started as a missed call? Ours text back now with a booking link. Game changer for £19/mo.'
Directory listing	'Missed-call text-back for UK businesses. Instant reply with your name, price and booking link. One missed job pays for a year.'
Waitlist email	Subject: 'The customer you lost last week' — story-driven, early-bird £19 locked, area-launch urgency.

Features benefits

Feature	Benefit
Missed call detected in seconds	Customer hears back while you're still working — they never have time to call the next guy
Auto text-back with your name & rough price	Feels personal, sets price expectations, filters out tyre-kickers
One-tap booking link	Customer books instead of 'calling back later' — later never happens
Works with existing number	No new number on the van, the shop window, or the website — customers keep calling the number they know
Missed-call feed	Know exactly what you missed and what you recovered — the ROI is visible
WhatsApp text-back	Reaches the customer in the app they actually check
Per-industry templates	Salons, clinics, agents and trades each get message defaults that match how their customers talk
Quiet hours	Business controls when the bot answers — no calls from mum at 11pm get the boiler price

Objection handling

Objection	Response
'Do my customers need an app?'	No — they get a normal text or WhatsApp message on any phone. Nothing to install.
'Do I need a new number?'	No — it attaches to your existing number via call forwarding. You keep taking calls the same way; we just catch the misses.

Objection	Response
'What if I'm not on a job and just don't want to answer?'	Set your hours and quiet time — outside them, calls go straight to auto-text-back.
'Isn't this just for plumbers?'	No — any business that misses calls: salons, clinics, estate agents, repair services and more. Trades get early access first; others onboard by demand.
'Why £19? What's the catch?'	Early-bird pricing, locked for everyone on the waitlist. One recovered job pays for the year. No contracts, cancel anytime.

6 Go-to-Market Plan

Three phases, each with an explicit go/no-go decision. The validation gate (Phase 0) protects the build from being wasted on a market that isn't reaching for the product.

Phase	Timeline	Objective	Go/no-go
0 — Validate	Weeks 1–3	50+ real waitlist signups from targeted outreach; BetaList live; first social proof	50+ signups build the beta. Under 50 re-evaluate messaging/segment before spending on the product
1 — Launch	Weeks 4–12	First 10–20 installs as free beta; first 20+ paying businesses; referral loop running	Activation $\geq 40\%$ of cohort & first 5 paying open paid marketing
2 — Scale	Months 3–6	Winning channels at £15–25/day; £380£1,500+ MRR; partnerships (associations, suppliers)	CAC < £40 and payback < 2 months scale spend; otherwise kill the channel

Phase 0 priorities (this week)

- Submit to BetaList (package already prepared in docs/betalist-submission.md).
- Seed the waitlist: founder posts in 5–10 UK trade Facebook groups, r/Plumbing, r/DIYUK, Indie Hackers — story-led, no hard sell.
- Install basic analytics on the landing page (page views, form drop-off) so signup conversion is measurable from day one.
- Capture signup source (UTM on each channel link) so we know where the 50 signups came from.
- Prepare the waitlist nurture email sequence (3 emails: story early-bird lock launch announcement).

Phase 1 launch checklist

- Convert waitlist beta cohort: 10–20 installs, 14-day free trial, concierge onboarding (set up their message & price range with them).
- Launch referral program: 1 month free for every business that brings a paying signup.
- Switch on Google Search Ads (small test) on high-intent terms — see Channel Plan.
- Collect 5–10 customer stories / screenshots of recovered jobs for social proof.
- Watch every activation: first text-back received within 24h of setup is the 'aha' to optimise toward.

7 Channel Plan

Channels are hypotheses. The 90-day job is to test each with real spend/effort, keep the winners, and kill the losers by week 6 — before budget bleeds. A lean solo-founder budget of ~£300/month is enough to get signal.

Channel	Role	Budget (90d)	Target CAC	How to win
BetaList + launch directories	First cold traffic + press/backlinks	£0	£0 (organic)	Strong listing, 3 screenshots, category Communication/Business Tools, status 'Beta — waitlist'
Google Search Ads	High-intent buyers ('missed call text back', 'auto reply missed calls', 'callcatch alternative')	£450 (£15/day)	≤ £35	Exact/phrase match, 5–8 ads, landing waitlist with UTM; add competitor terms
Facebook / Instagram	Trades are heavy FB users; interest + radius targeting; retargeting	£300 (£10/day)	≤ £40	Video-first (ladder POV), 10-mile radius around target postcodes, retarget waitlist visitors
Trade communities (FB groups, Reddit, forums)	Trusted, free, founder-led demand	£0	£0	Genuine participation + story posts, not spam; DM follow-ups; screenshots of recovered jobs
Local SEO & Google Business Profile	Long-term organic capture ('plumber near me' answer the call better)	£0	£0	GBP posts, review generation, keyword-tuned landing copy
Referral programme	Trades know trades — highest-trust channel	1 month credit/ref	£19 (credit)	In-app 'Refer a trade' + concierge ask at activation
Content (TikTok/Reels)	Brand + inbound over months 2–6	£0	£0	2–3 clips/week: POV, 'jobs I recovered this week', trade humour; link in bio
Waitlist nurture email	Convert existing signups — the cheapest revenue	£0	£0	3-email sequence + launch-day blast with early-bird deadline
Partnerships (NICEIC, CIPHE, FMB, Plumb Center/Screwfix trade counters)	Credibility + volume in months 4+	£0 (time)	Low	Offer member-discount; trade-counter flyers with QR to waitlist

Channel discipline

Week 1–3: only free channels (communities, BetaList, email) — they also produce the 50-signup gate.

Week 4–6: start Search Ads (highest intent) + one social test at ~£10/day.

Week 6: kill list — any paid channel without at least 2 waitlist signups per £10 spent gets paused.

Month 3: put 70% of budget into the single winning channel; keep one testing slot.

8 Funnel & Conversion Plan

The funnel is short: visitor → waitlist → beta → install → activation (first text-back) → paying. Every stage has a benchmark target; the job is to measure and beat them.

Stage	Definition	Target rate (benchmark-based)	Leverage
Visit → waitlist	Landing page visit to email signup	2–4%	Copy, social proof counter, early-bird lock, mobile UX
Waitlist → beta → install	Signup to taking a 14-day trial	≥ 40%	Concierge onboarding, launch-day email, referral credit
Beta → paid	14-day trial to paying £19/mo	≥ 30%	Activation in first 24h, 'recovered job' screenshots, renewal email
Monthly churn	Paying businesses lost / month	< 5%	Value emails, referral credit, product velocity
CAC (paid)	Ad spend / new paying customer	≤ £40	Search intent terms, retargeting, referral mix
Payback	Months of revenue to recover CAC	< 2 months	Front-load activation; annual option at 2 months free

Worked example (planning, not prediction)

1,000 visitors in a month at 3% → 30 signups. At 40% activation → 12 trials. At 30% → ~4 paying. That path alone is slow — which is why referral (free) and Search (intent) are the growth engines, and why the activation rate is the single most important number to optimise: moving activation 40% → 55% adds ~2 paying customers per 100 signups.

Activation is the 'aha'

- A trader's first text-back received (a real customer replying or booking) within 24 hours of setup is the strongest predictor of retention — optimise everything toward it.
- Concierge onboarding in Phase 1: set up their name/message/price range with them over a 10-minute call.
- Show ROI weekly in the missed-call feed: 'This week you recovered 3 jobs worth ~£600.'

9 Budget — 90 Days (Lean)

Deliberately small. This budget buys signal, not scale: enough to identify the one channel that works before committing real money. All figures in GBP.

Line item	90-day spend	Notes
Google Search Ads	£450	£15/day weeks 4–12; pause any ad group with 0 signups after £60
Facebook / Instagram ads	£300	£10/day one test campaign; retargeting after week 6
Tools (email, analytics, landing)	£60	Free tiers where possible (email via Voxvaani/own stack, GA/Plausible, no paid landing builder)
Screenshots / creative	£20	Mock customer-phone images for ads & social
Contingency	£70	Unexpected test (one more channel or boosted post)
Total	£900 (~£300/mo)	≈ 47 months' revenue of one paying customer — deliberate asymmetry

Spend guardrails

Stop any channel after 3 weeks of spend if CAC $\geq$ £40 or no signups.

The 50-signup gate is achievable at £0 spend via communities + BetaList — paid channels are for scaling proof, not for reaching the gate.

Every £1 of ad spend must be traceable to a signup via UTM + waitlist source field.

10 KPIs & 90-Day Targets

North star

Number of paying trade businesses.

KPI	Now	Day 30 (gate)	Day 60	Day 90	Why it matters
Waitlist signups	0–20	50+	120+	250+	Validation gate + launch fuel
Landing signup rate	—	≥ 2%	≥ 2.5%	≥ 3%	Copy/messaging health
Beta installs (cumulative)	0	0	15–25	30–45	Funnel reach
Activation rate (first text-back)	—	—	≥ 40%	≥ 50%	Retention predictor
Paying businesses	0	0	5–10	20+	North star
MRR	£0	£0	£95–190	£380+	Revenue engine
Churn	—	—	< 5%/mo	< 5%/mo	LTV assumption
CAC (paid mix)	—	—	≤ £40	≤ £35	Unit economics
Payback	—	—	< 2 mo	< 2 mo	Cash-flow safety

These are targets derived from benchmark ranges for B2B SaaS micro-products — they will be replaced by actuals as data arrives. No figure here is a promise of performance; the 90-day review re-baselines everything against real numbers.

11 Roadmap — 30 / 60 / 90

Window	Focus	Key actions
Days 0–30	Validate & prepare	BetaList submission; 5–10 trade-group/Reddit posts; UTM + analytics live; 3-email nurture sequence; first 50 signups tracked by source; no product spend until gate is met
Days 31–60	Launch beta & first revenue	Convert waitlist 10–20 beta installs with concierge onboarding; referral programme live; Search Ads test (£15/day); first 5–10 paying; 5 customer screenshots; kill-list review at week 6
Days 61–90	Scale the winner	70% budget into the winning channel; GBPs + local SEO pass; partnerships outreach (associations, trade counters); 20+ paying / £380+ MRR; 90-day review: re-baseline targets, decide scale vs refine

Decision rules that end the experiment cleanly

- Gate miss: under 50 signups at day 30 the message or the segment is wrong. Re-interview 10 signups/non-signups, re-run 2 weeks, then decide build/hold.
- Activation wall: beta installs but <40% get a first text-back onboarding or delivery (call forwarding) is broken; fix before scaling ads.
- Unit economics fail: CAC > £40 with payback > 2 months at day 90 product is the constraint, not marketing.

12 Risks & Mitigations

Risk	Likelihood	Impact	Mitigation
'Works with existing number' fails on some UK networks (conditional forwarding support varies)	Medium	High — core promise	Test on the 4 major networks before launch; ship virtual-number fallback (Voxvaani stack) that keeps the same customer UX; position setup as '5 minutes with our help'
WhatsApp Business API / DLT template approval delays or rejections	Medium	High	Start template pre-approval early; SMS text-back as the always-on fallback so delivery never depends on one channel
Carrier/SMS spam filtering on text-backs	Medium	Medium	Use registered sender IDs, keep messages short and non-spammy, monitor delivery receipts, WhatsApp-first where possible
Lead-gen marketplaces out-spend and out-brand (Checktrade etc.)	High	Medium	Don't compete on lead flow — compete on owning the trader's own missed calls; price and message are complementary, not head-on
Generic copycats (SMS gateway + Zapier) emerge at lower price	Medium	Medium	Moat = WhatsApp-native DLT compliance + booking-link UX + trades-specialist positioning; move fast in launch window
Seasonality — heating call volume collapses in summer	Medium	Low	Launch into winter (peak for plumbers); multi-segment mix (electricians, roofers) smooths the curve
Solo-founder bandwidth (Voxvaani + Calloto + support)	High	Medium	One channel at a time; concierge onboarding is also the feedback loop; automate activation emails and referral crediting from day one

Technical honesty (for the build decision)

The 'existing number' promise is the highest-risk feature. The landing page sells it, so the beta must prove it across UK networks before charging anyone. If forwarding is flaky, the fallback is a Voxvaani virtual number that the customer dials — same text-back experience, slightly different setup story. Decide this in beta, not after the first 100 paying customers.

13 Launch Assets Checklist

Asset	Status	Owner / notes
Landing page + waitlist (waitlist API, position counter, industry segment picker)	DONE	Live at sslip.io URL; segment data decides next vertical; add /data volume before real signups
BetaList submission package	DONE	docs/betalist-submission.md — submit this week
Analytics on landing (views, form events, UTM)	TODO	Install before Phase 0 outreach
Waitlist nurture emails (3-email sequence)	TODO	Story early-bird lock launch; from Voxvaani sender
Demo video (30–60s, phone screenshots)	TODO	Customer phone POV: call text booked
Google Business Profile for 'Calloto' brand page	TODO	Long-term organic; also for GBP review engine

Asset	Status	Owner / notes
Facebook page + 5 trade-group participation	TODO	Founder-led, story-first
Referral mechanic (1 month credit)	TODO	Launch with Phase 1
Case-study template + recovered-job screenshots	TODO	First 5 customers social proof pack

Calloto — marketing plan v1.0. Prepared for Mudit Gupta, August 2026. All targets are planning hypotheses pending real data. Re-baseline at the day-30 gate and the day-90 review.
